# MEASURING GREENHOUSE GAS EMISSIONS IN THE SASKATCHEWAN CROP SECTOR

Lana Awada APAS April 2, 2019

- Action towards reducing greenhouse gas (GHG) emissions have been steadily progressing in the Saskatchewan (SK) crop sector since the 1980s
- Adoption of sustainable farming practices has enhanced carbon sequestration and contributed to reducing GHG emissions
- This reduction helps Canada in meeting its commitment in the 21<sup>st</sup> Conference of the Parties (COP21) in Paris toward the United Nations Framework Convention on Climate Change (UNFCCC) to cut GHG emissions by 30 percent below 2005 emissions by 2030
- Land use, Land use change, and the forestry (LULUCF) sector are included in the measurement of national GHG inventories
  - This is important for SK, as the province accounts for approximately 38% of Canada's farmland or about 25 Mha

## OVERVIEW: PAN-CANADIAN FRAMEWORK (PCF) ON CLEAN GROWTH AND CLIMATE CHANGE

- December 9, 2016: Pan-Canadian Framework on Clean Growth and Climate Change
- The PCF aims to grow the economy while reducing GHG emissions
- Pricing carbon pollution across Canada
- Provinces and territories have the flexibility to design their own pricing system
- Revenue generated from pricing carbon will remain in the province or territory of origin

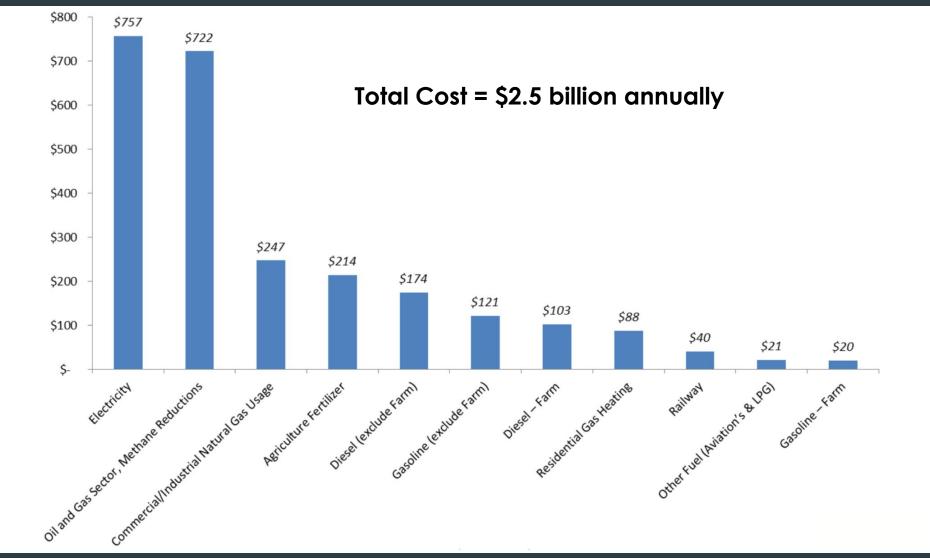

# **CARBON POLLUTION PRICING: PROVINCIAL**

- Saskatchewan remains the only jurisdiction that has not joined the PCF
- Saskatchewan released "The Prairie Resilience: A Made in Saskatchewan Climate Change Strategy"
  - Natural systems
  - Infrastructure
  - Economic sustainability
- On August 29, 2018, SK released carbon pollution price, based on an output-based performance standards (https://www.canada.ca/en/environment-climatechange/services/climate-change/pricing-pollution-how-it-willwork/saskatchewan.html)
  - Implementation date: January 2019
  - Apply to large industrial facilities that emit more 25,000 tonne of  $\mathrm{CO}_2\text{-}$  eq/year
  - exception of electricity generation and natural gas transmission pipelines
  - Cover 11% of the province's emissions

# **CARBON POLLUTION PRICING: FEDERAL**

- The federal carbon pollution pricing system will be partially implemented in SK
  - Federal output-based pricing system (OBPS): apply to electricity generation and natural gas transmission pipelines in January 2019 & cover facilities that emit 50,000 tonne CO<sub>2</sub>-eq/year (http://publications.gc.ca/collections/collection 2018/eccc/En1-77-2018-eng.pdf)
  - Federal fuel charge: apply in April 2019, the fuel charge price is \$20/tonne CO<sub>2</sub>-eq in 2019, rising by \$10 per tonne annually to \$50/tonne in 2022 (fuel charge rates https://www.fin.gc.ca/n18/data/18-097\_1-eng.asp)
- Federal carbon pricing will exempt gasoline and diesel fuel used by registered farmers in certain farming activities

### **MEASURING GHG IN THE SK CROP SECTOR**

- **Quantify** the net GHG in the SK crop sector during the period 1985-2016
- Assessment of <u>emission and sink</u> of the main crop GHGs including:
- Soil Carbon Sequestration/Carbon Sink (CO<sub>2</sub>)
- Crop Production Emissions:
  - N<sub>2</sub>O Emission from Fertilizer Application
  - N<sub>2</sub>O Emission from Crop Residue
  - N<sub>2</sub>O Emissions from Summerfallow
  - CO<sub>2</sub> Emission from Fuel Used on Farm and for Transportation
- Net GHG = Soil Carbon Sequestration Crop Production Emissions
- The 2016 estimates will be compared to those of 2005 and 1985 (base year) to track the historical changes in reducing SK GHG emissions in the crop sector

# **METHOD OF MEASUREMENT**

- Conducted at crop districts which divides SK into nine and five soil-climate zones brown, dark brown, thin black, thick black and gray
- Arable land suitable for the production of: cereal, oilseed, and pulse crops, and alfalfa, hay, grass, and pasture
- Apply the Prairie Crop Energy Model (PCEM) to allocate cropland to 122 cropping activities
- Each cropping activity can be produced by one of the three tillage practices, conventional tillage (CT), minimum tillage (MT) and no-till (NT), and be grown using fallow-crop rotation or crop-crop rotation

# SOIL CARBON SEQUESTRATION IN THE SK CROP SECTOR

- Soils can be either a source of or sink for CO<sub>2</sub>, depending on current and historical crop production practices
- Source-sink behaviour is primarily influenced by:
  - the processes of photosynthesis and incorporation of crop-residue organic matter into soils (CO<sub>2</sub> sink/sequestration)
  - the decomposition of that organic matter by soil organisms (CO<sub>2</sub> source)
- NT land management has enabled higher carbon return to soil through intensified crop rotations, residue retention, and lower SOM decomposition rates associated with reduced summerfallow and tillage practices
- NT enhances soil water storage capacity: increases SOM and soil biomass; increase in SOC stocks

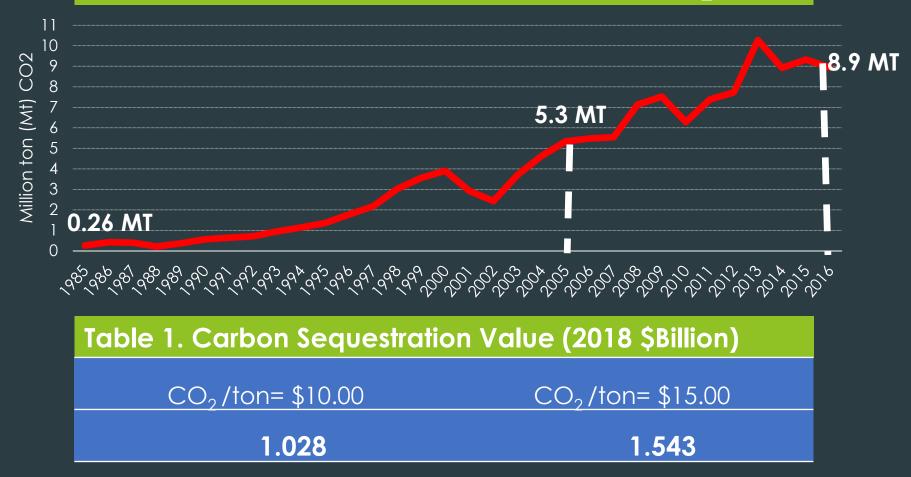

### SOIL CARBON SEQUESTRATION IN THE SK CROP SECTOR

(1) 
$$CS_t = \sum_{i=1}^{9} \sum_{j=1}^{122} [A_{ijt} \times RC_{ij}] \times [R_{ijt} \times RR_{ij}] \times CO_2 MW$$

 $A_{ijt}$  is cropland (ha),  $RC_{ij}$  is sequestration rate,  $R_{ijt}$  is crop residue estimated using the total biomass produced from harvested yield,  $RR_{ij}$  is the rate of crop residue input C into soil, and  $CO_2MW$  is the ratio of molecular weight=44/12

# Figure 6. Soil Carbon Sequestration in Saskatchewan's Crop Sector 1985-2016 (Mt $CO_2$ -eq)

Total Carbon Sequestration = 125 Mt  $CO_2$ -eq

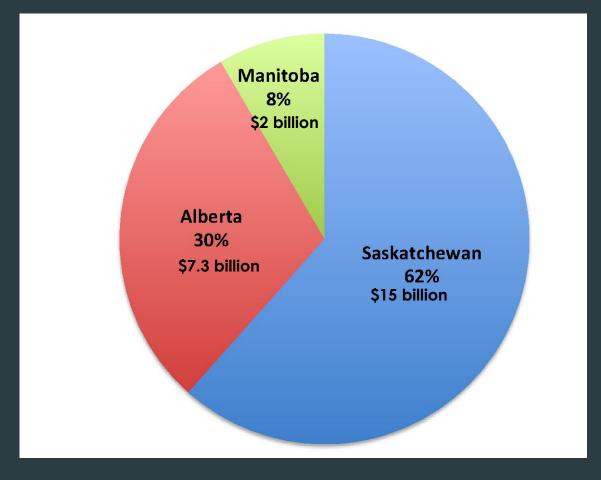

# Figure 7. No-tillage Benefits on the Prairies 1985-2012 (\$2014)

Source: Awada et al. (2015). Canadian Journal of Agricultural Economics 00 1–22

### Figure 8. No-Tillage Benefits 1985-2012 (\$2014)

# **CROP PRODUCTION EMISSIONS**

• N<sub>2</sub>O Emission from Fertilizer Application:

(2) N<sub>2</sub>O<sub>t</sub>\_N<sub>t</sub> = 
$$\sum_{i=1}^{9} \sum_{j=1}^{122} A_{ijt} \times N_{ij} \times NE_i \times N_2OMW$$

 $N_{ij}$  is nitrogen N rate-requirement,  $NE_i$  is emission rate, and  $N_2OMW$  is the ratio of molecular weights=44/28

#### • N<sub>2</sub>O Emission from Crop Residue

(3) 
$$N_2O_R_t = \sum_{i=1}^9 \sum_{j=1}^{122} R_{ijt} \times (NA_j \times RA_j + NB_j \times RB_j) \times NR \times N_2OMW$$

*NA<sub>j</sub>*, *NB<sub>j</sub>*, *RA<sub>j</sub>* and *RB<sub>j</sub>* are N content and ratio of residues to harvest yield of above-ground and below-ground, respectively

# **CROP PRODUCTION EMISSIONS (CONT.)**

N<sub>2</sub>O Emissions from Summerfallow

(4) 
$$N_2 O_S_t = \sum_{i=1}^{9} (N_2 O_N_{it} + N_2 O_R_{it}) \times FS_{it}$$

 $FS_{it}$  is fraction of cropland that is under summerfallow

CO<sub>2</sub> Emission from Fuel Used on Farm and for Transportation

 $[(5) CO_{2_{F_{t}}} = \sum_{i=1}^{9} \sum_{j=1}^{122} \left[ (A_{ijt} \times FC_{1}) + (A_{ijt} \times FC_{2} + Y_{ijt} \times FC_{3}) \right] \times FCF$ 

 $FC_s$  are rates of fuel consumption; FCF is emission factor of the amount of  $CO_2$ -eq emitted from powered equipment

### Figure 9. Crop Production Emissions (cont.)

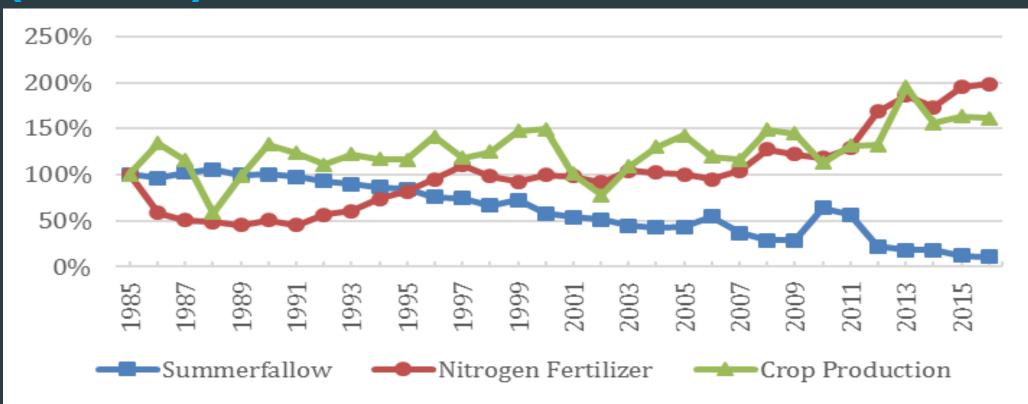

# **CROP PRODUCTION EMISSIONS (CONT.)**

Fuel	Table 2. (	Crop Produc	tion Emissio	ns (Mt CO <sub>2</sub> -ec	
					Fuel

Years	Residues	Fertilizer	Fallow	Fuel on farm	Transport
1985	1.510	0.759	0.883	1.837	0.274
2005	2.358	1.215	0.579	1.425	0.644
2016	2.728	2.246	0.190	1.258	2.645

# Figure 10. Crop production, nitrogen fertilizer use and summer-fallow area, 1985-2016 (% acre change) (1985=100)

### FARM FUEL FOR TRANSPORTATION

- Increased farm size resulted in longer distances from farm yard to farm land, affecting fuel used supplying crop inputs and hauling harvested grain to the yard site
- Reduction in the number of grain bins in the field as farmers centralize operations
- Grain delivery points in Saskatchewan have been reduced from 1,031 in 1985 to 162 in 2016
- Consolidation of crop input suppliers as many of the grain delivery points also sell crop inputs

### Figure 10. Net GHG Emission/Sink in the Sk Crop Sector 1985-2016

# CONCLUSION

- Adoption of sustainable farming practices increased carbon sequestration and reduced net GHG emissions
- Carbon sequestration increased from 0.26 in 1985, to 5.3 in 2005, and to 9Mt CO\_2-eq in 2016
- Decrease in net GHG emissions: which went from 5Mt CO<sub>2</sub>-eq in 1985, to 0.9 in 2005, and to 0.1Mt CO<sub>2</sub>-eq in 2016
- This decrease exceeds, by multifold, Canada's commitment toward COP21 to cut GHG emissions by 30% below 2005 emissions by 2030.
- The great efforts by the SK farmers since the 1985 should be recognized and compensated, as a large amount of carbon was mitigated before 2005.
- The results of this study provide evidence that might support the design of policies that encourage the adoption of sustainable practices to mitigate GHG emissions in agriculture

# THANK YOU!
